Case No.: F-2018-00133
Segment: S/ES-0001, S/ES-0002,
S/ES-0003, EB-0001

Mr. William F. Marshall
Judicial Watch

Dear Mr. Marshall:

In response to your request dated December 22, 2017 under the Freedom of Information Act (the "FOIA"), 5 U.S.C. § 552, the Department of State retrieved three records responsive to your request. After reviewing these documents, we have determined that two may be released in full and one must be withheld in full.

An enclosure explains the FOIA exemptions and other grounds for withholding material. The one document denied in full was withheld under FOIA Exemptions 3 and 5, 5 U.S.C. §§ 552(b)(3) and (b)(5). All non-exempt material that is reasonably segregable from exempt material has been released in the enclosed pages.

The processing of your request is ongoing. If you have any questions, your attorney may contact Joshua Kolsky, Assistant U.S. Attorney, at Joshua.Kolsky@usdoj.gov. Please refer to the request case number, F-2018-00133, and the civil action number, 18-cv-00722, in all correspondence about this request.

Sincerely,

Eric F. Stein, Director
Office of Information Programs and Services

Enclosures: As stated.

The Freedom of Information Act (5 USC 552)

FOIA Exemptions

- (b)(1) Information specifically authorized by an executive order to be kept secret in the interest of national defense or foreign policy. Executive Order 13526 includes the following classification categories:
- 1.4(a) Military plans, systems, or operations
 - 1.4(b) Foreign government information
 - 1.4(c) Intelligence activities, sources or methods, or cryptology
 - 1.4(d) Foreign relations or foreign activities of the US, including confidential sources
 - 1.4(e) Scientific, technological, or economic matters relating to national security, including defense against transnational terrorism
 - 1.4(f) U.S. Government programs for safeguarding nuclear materials or facilities
 - 1.4(g) Vulnerabilities or capabilities of systems, installations, infrastructures, projects, plans, or protection services relating to US national security, including defense against transnational terrorism
 - 1.4(h) Weapons of mass destruction
- (b)(2) Related solely to the internal personnel rules and practices of an agency
- (b)(3) Specifically exempted from disclosure by statute (other than 5 USC 552), for example:
- | | |
|----------------|---|
| ARMSEXP | Arms Export Control Act, 50a USC 2411(c) |
| CIA PERS/ORG | Central Intelligence Agency Act of 1949, 50 USC 403(g) |
| EXPORT CONTROL | Export Administration Act of 1979, 50 USC App. Sec. 2411(c) |
| FS ACT | Foreign Service Act of 1980, 22 USC 4004 |
| INA | Immigration and Nationality Act, 8 USC 1202(f), Sec. 222(f) |
| IRAN | Iran Claims Settlement Act, Public Law 99-99, Sec. 505 |
- (b)(4) Trade secrets and confidential commercial or financial information
- (b)(5) Interagency or intra-agency communications forming part of the deliberative process, attorney-client privilege, or attorney work product
- (b)(6) Personal privacy information
- (b)(7) Law enforcement information whose disclosure would:
- (A) interfere with enforcement proceedings
 - (B) deprive a person of a fair trial
 - (C) constitute an unwarranted invasion of personal privacy
 - (D) disclose confidential sources
 - (E) disclose investigation techniques
 - (F) endanger life or physical safety of an individual
- (b)(8) Prepared by or for a government agency regulating or supervising financial institutions
- (b)(9) Geological and geophysical information and data, including maps, concerning wells

Other Grounds for Withholding

- NR Material not responsive to a FOIA request excised with the agreement of the requester

Congress of the United States
Washington, DC 20515

RELEASE IN FULL

October 5, 2010

The Honorable Timothy F. Geithner
Secretary
U.S. Department of the Treasury
Chairman, Committee on Foreign Investment in the United States
c/o Mr. Aimen Mir
Director, Office of Investment Security and Staff Chairperson, CFIUS
1500 Pennsylvania Avenue, N.W., Room 5221
Washington, D.C. 20220

Dear Mr. Secretary,

We are writing to express our great concerns regarding the pending sale of a uranium processing facility operated by Uranium One USA to Atomredmetzoloto, the mining arm of Rosatom, the Russian government agency that oversees Russia's nuclear industry. We believe that this transaction could threaten to impair the national security of the United States and respectfully urge the Committee to recommend the President block this transaction or postpone any action until the CFIUS has carefully evaluated the concerns outlined below and the separate Congressional review on the U.S.-Russia nuclear cooperation agreement has been completed.

On August 31, 2010, the parties announced that the ARMZ Uranium Holding Co. had purchased a controlling 51 percent interest share in Uranium One, Inc. Uranium One USA, the American subsidiary of Uranium One, Inc., operates a uranium processing facility in Wyoming. The sale could reportedly give Russia control of about 20 percent of U.S. uranium extraction capacity.

ARMZ is the successor to the world's largest uranium producer built by the Soviet Union. ARMZ is the primary supplier of uranium feedstock to the Russian nuclear industry. ARMZ is wholly owned by Rosatom, which accounts for one-fifth of the new reactors under construction worldwide and 17 percent of global nuclear fuel fabrication.

Rosatom's specific activities -- and the context within which it operates in Russia -- should raise very serious concerns for United States national security interests.

Rosatom is a state-owned entity, overseen by a government that has shown little if any inclination to effectively address the widespread and continuing corruption within Russia, particularly its energy sector.

Moreover, Rosatom has been engaged in a series of on-going and potential civilian nuclear activities that should raise red flags in the consideration of the purchase of Uranium One by the Rosatom subsidiary ARMZ:

Russia's Rosatom trained Iranian scientists and designed and built Iran's Bushehr nuclear power plant, which became operational in August, 2010. Russia now supplies this nuclear plant at Bushehr with enriched-uranium fuel rods and then is to remove the spent fuel rods that could otherwise be used to make weapons-grade plutonium.

In 2007, Rosatom signed an agreement to help build nuclear facilities in Burma and train Burmese scientists, despite U.S. concerns about the Burmese regime. A State Department spokesman at the time said the following with regard to that agreement: "We would be concerned about the possibility for accidents, for environmental damage, or for proliferation simply by the possibility of fuel being diverted, stolen or otherwise removed."

Despite criticism by environmental and nonproliferation experts, Rosatom has launched a program to build and sell floating nuclear power plants to countries around the world, with little demonstrated intent or capability to protect those floating reactors from attack or theft of nuclear materials or from accidents that could have devastating and widespread impact. With regard to proliferation, some observers are concerned over the possibility that, by operating such a floating reactor far from its soil, a host nation might be able to bypass the proliferation guidelines of the Nuclear Suppliers Group and the International Atomic Energy Agency.

It is our understanding that the US Department of State itself has this year warned that the expansion of Russia in the area of nuclear energy could involve the appearance of new danger zones in the world.

Further, in a 2007 report on nuclear nonproliferation, the General Accounting Office noted that despite the US Department of Energy's provision of access by Russian officials to sensitive nuclear sites in the United States, Rosatom "denied [GAO's] request for access to facilities...[and] denied DOE proposals for upgrading the sites including proposals with less intrusive access requirements, and informed DOE that it is not interested in pursuing [Materials Protection, Control and Accounting] MPC&A cooperation at these sites."

Russian entities are of particular concern with regard to foreign control of U.S. nuclear-related assets.

Since 1998, at least 19 different Russian entities have been placed under proliferation-related sanctions on over 20 different occasions. Indeed, a 2009 report by the Director of

National Intelligence to Congress stated that Russian entities continue to sell technologies and components in the Middle East and South Asia that are dual use and could support WMD and missile programs. Additionally, the Department of Commerce lists eight Russian entities subject to license requirements for proliferation-related end-use or end-user controls, five of which are under "presumption of denial."

In addition to the Bushehr nuclear plant, Russia has also indicated its interest in building further nuclear reactors in Iran. This cooperation has caused great distress that it could advance Iran's nuclear ambitions, be it through the extraction of weapons-grade plutonium from the reactor or the use of Bushehr (and any future additional reactors) as a cover for the prohibited transfer of other sensitive technology. It has also undermined longstanding efforts to compel Iran to abandon its pursuit of nuclear weapons.

Although Uranium One USA officials are reportedly skeptical that the transaction would result in the transfer of any mined uranium to Iran, we remain concerned that Iran could receive uranium supplies through direct or secondary proliferation.

However, the potential threat to U.S. security interests posed by the proposed transaction involving ARMZ (Rosatom) is not limited to Iran.

In May of this year, Russian President Dmitri Medvedev and Syrian leader Bashar al-Assad announced they were discussing future Russia-Syria nuclear cooperation.

Months later, in a report issued in September, the International Atomic Energy Agency (IAEA) stated that Syria continues to block its inspection of the nuclear facility destroyed by an Israeli airstrike in 2007 that had been built by North Korea for use in Syria's nuclear weapons program. Russia's eagerness to begin nuclear cooperation with Syria in these circumstances can only be seen in Damascus as strong backing for its nuclear ambitions, which is similar to the support Russia has given to Iran's nuclear program. The facilities, materials, technology, and expertise that could be provided to Syria, even for a "peaceful" program, would likely be used for a renewed weapons program, regardless of any assurances the Russians might provide. Russia's support for Syria's nuclear ambitions raises particular proliferation concerns given Syria's status as a country of proliferation concern and a state sponsor of terrorism.

These are just a few of the national security concerns that have prompted strong opposition to the proposed U.S.-Russia nuclear cooperation agreement (123 Agreement) now under consideration by Congress. The agreement cannot be defended on its merits. Both, the Bush and Obama administrations, have been unable to certify that Russian officials, individuals, and organizations are not still assisting Iran's nuclear program, as has occurred on many occasions over the past two decades. That agreement has yet to be approved and may need to be taken up again in the next Congress, where it is likely to be subjected to much greater scrutiny and potential corrective action.

We believe the take-over of essential U.S. nuclear resources by a government-owned Russian agency, as would occur under the proposed transaction, would not advance the national security and interests of the United States. We urge the Committee to recommend the President block this transaction. In the alternative, we ask the Committee to consider postponing any action on the transaction involving Uranium One, Inc. and ARMZ until the Congressional review on the U.S.-Russia nuclear cooperation agreement has been completed.

We appreciate the opportunity to share our views and concerns with you.

Sincerely,

RELEASE IN FULL

News Release

January 14, 2013

Uranium One Enters into Definitive Agreement with ARMZ for Going Private Transaction for CDN\$2.86 per Share in Cash

Board Unanimously Recommends Transaction

Toronto, Ontario – Uranium One Inc. (“Uranium One” or the “Company”) today announced that it has entered into a definitive agreement (the “Arrangement Agreement”) with JSC Atomredmetzoloto and its affiliate, Effective Energy N.V., (collectively “ARMZ”) under which the Company would be taken private pursuant to a plan of arrangement (the “Plan of Arrangement”). ARMZ and its affiliates currently own 51.4% of the Uranium One common shares (“Common Shares”).

Under the Plan of Arrangement, ARMZ would acquire all of the Common Shares that ARMZ and its affiliates do not already own for cash consideration of CDN\$2.86 per share. The cash consideration represents a 32% premium to the 20-day volume weighted average price of the Common Shares on the Toronto Stock Exchange for the period ending January 11, 2013. The transaction provides total consideration to minority shareholders of approximately CDN\$1.3 billion and implies an equity value for Uranium One of approximately CDN\$2.8 billion.

The Board of Directors of Uranium One has unanimously (with Messrs. Jivov, Sattler and Yampolskiy abstaining) determined that the Plan of Arrangement is in the best interests of Uranium One and is fair to its shareholders.

The determination of the Board was made upon the recommendation of a special committee of independent directors (the “Independent Committee”), and after consideration of the advice of legal and financial advisors to the Independent Committee and the Company.

Ken Williamson, Chairman of the Independent Committee stated “This proposal represents a significant premium to the 20 day volume weighted average price of the Common Shares prior to today’s announcement. We recommend that shareholders vote in favour of the Plan of Arrangement at the special meeting of shareholders that will be called to approve the transaction.”

Bay Adelaide Centre • Suite 1710, Box 23
Toronto • ON • CANADA • M5H 2R2

TSX:UUN JSE:UUN

Canaccord Genuity Corp., which is acting as financial advisor to the Independent Committee, has provided an opinion to the effect that, as of the date of the opinion and based upon and subject to the limitations and qualifications therein, the consideration to be received for the Common Shares is fair, from a financial point of view, to the holders of the common shares (other than ARMZ and its affiliates). GMP Securities L.P. has prepared and delivered a formal valuation of the Common Shares under the supervision of the Independent Committee as contemplated by Multilateral Instrument 61-101 – *Protection of Minority Security Holders in Special Transactions* (“MI 61-101”). GMP Securities L.P. concluded that, subject to the assumptions, qualifications and limitations provided in the formal valuation, that the fair market value of a Uranium One common share is in the range of US\$2.66 to US\$3.21 (equivalent to CDN\$2.62 to CDN\$3.16 using Friday’s closing exchange rate of 1.0154) as at the date of the formal valuation.

“Despite the uranium industry’s currently challenging outlook, ARMZ will continue with its strategy of developing Uranium One into the leading global uranium producer, which was the basis of our original investment in the Company,” said Vadim Jivov, Chairman of the Board of ARMZ.

The implementation of the Plan of Arrangement will be subject to approval by the holders of the affected securities at a special meeting (the “Special Meeting”) expected to be held in March 2013. As the transaction will constitute a “business combination” for the purposes of MI 61-101, the implementation of the Plan of Arrangement will be subject to approval by a majority of the votes cast by shareholders other than ARMZ and its affiliates, in addition to approval by 66 $\frac{2}{3}$ % of the votes cast by holders of Common Shares. The transaction also will be subject to applicable regulatory approvals and certain closing conditions customary in transactions of this nature.

The Arrangement Agreement provides for, among other things, a non-solicitation covenant on the part of Uranium One (subject to customary fiduciary out provisions). The Arrangement Agreement also provides ARMZ with a “right to match” and requires the Company to pay a termination fee equal to CDN\$45 million in certain circumstances. All of the directors and senior officers of Uranium One have entered into voting agreements pursuant to which, among other things, they have agreed to vote their Common Shares in favour of the Plan of Arrangement.

The terms and conditions of the proposed transaction will be disclosed in an information circular that will be mailed in February 2013 to the securityholders of Uranium One that will be entitled to vote at the Special Meeting. It is anticipated that the transaction, if approved by Uranium One securityholders and the Court, will be completed in the second quarter of 2013.

Within 30 days of completion of the transaction, Uranium One will make an offer to purchase the \$259,985,000 aggregate principal amount of 7.5% (re-set to 5%) convertible unsecured subordinated debentures due March 13, 2015 (the “Debentures”) as prescribed

by the terms of the Debentures. The completion of the transaction is not dependent on any approval from the Debenture holders or the acceptance of the offer to purchase.

Goodmans LLP and Cassels Brock & Blackwell LLP are acting as legal counsel to Uranium One and the Independent Committee, respectively. BMO Capital Markets is acting as financial advisor, and Stikeman Elliott LLP is acting as legal counsel, to ARMZ.

Uranium One has engaged Kingsdale Shareholder Services Inc. as its proxy solicitation agent.

Copies of the Arrangement Agreement, the information circular for the Special Meeting and certain related documents will be filed with Canadian securities regulators and will be available on the Canadian SEDAR website at www.sedar.com.

About Uranium One

Uranium One is one of the world's largest publicly-traded uranium producers with a globally diversified portfolio of assets located in Kazakhstan, the United States, Australia and Tanzania. ARMZ and its affiliates currently are Uranium One's largest shareholder, owning approximately 492.2 million (approximately 51.4% of the outstanding) common shares of Uranium One.

Cautionary Statement

No stock exchange, securities commission or other regulatory authority has approved or disapproved the information contained herein.

Investors are advised to refer to independent technical reports containing detailed information with respect to the material properties of Uranium One. These technical reports are available under the profile of Uranium One Inc. at www.sedar.com. Those technical reports provide the date of each resource or reserve estimate, details of the key assumptions, methods and parameters used in the estimates, details of quantity and grade or quality of each resource or reserve and a general discussion of the extent to which the estimate may be materially affected by any known environmental, permitting, legal, taxation, socio political, marketing, or other relevant issues. The technical reports also provide information with respect to data verification in the estimation.

Forward-looking statements:

This press release contains "forward-looking statements" within the meaning of applicable securities laws that are intended to be covered by the safe harbours created by those laws including statements that use forward looking terminology such as "may", "will", "expect", "anticipate", "believe", "continue", "potential", or the negative thereof or other variations thereof or comparable terminology. Such forward-looking statements may include, without limitation, statements regarding the completion of the proposed transaction and other statements that are not historical facts. While such forward-looking statements are expressed by Uranium One, as stated in this release, in good faith and believed by Uranium One to have a reasonable basis, they are subject to important risks and uncertainties including, without limitation, approval of applicable governmental authorities, required Uranium One securityholder approval and necessary Court approvals, the satisfaction or waiver of certain other conditions contemplated by the

Arrangement Agreement, and changes in applicable laws or regulations, which could cause actual results to differ materially from future results expressed, projected or implied by the forward-looking statements. As a result of these risks and uncertainties, the proposed transaction could be modified, restructured or not be completed, and the results or events predicted in these forward-looking statements may differ materially from actual results or events. These forward-looking statements are not guarantees of future performance, given that they involve risks and uncertainties. Uranium One is not affirming or adopting any statements made by any other person in respect of the proposed transaction and expressly disclaims any intention or obligation to update or revise any forward-looking statements, whether as a result of new information, future events or otherwise, except in accordance with applicable securities or to comment on expectations of, or statements made by any other person in respect of the proposed transaction. Investors should not assume that any lack of update to a previously issued forward-looking statement constitutes a reaffirmation of that statement. Reliance on forward-looking statements is at investors' own risk.

Mr. William F. Marshall
Judicial Watch

Dear Mr. Marshall:

I refer to our letter dated August 31, 2018 regarding the release of certain Department of State material under the Freedom of Information Act (the "FOIA"), 5 U.S.C. § 552. The processing of records is ongoing and has, thus far, yielded an additional 54 records responsive to your request. After reviewing these documents, we have determined that 1 may be released in full and 53 must be withheld in full.

An enclosure explains the FOIA exemptions and other grounds for withholding material. The documents denied in full were withheld under FOIA Exemptions 1, 3, and 5, 5 U.S.C. §§ 552(b)(1), (b)(3), and (b)(5). All non-exempt information that is reasonably segregable from the exempt information has been released. All released material is enclosed.

The processing of your request is ongoing. If you have any questions, your attorney may contact Joshua Kolsky, Assistant U.S. Attorney. Please refer to the request case number, F-2018-00133, and the civil action number, 18-cv-00722, in all correspondence about this request.

Sincerely,

Susan C. Weetman
Chief, Programs and Policies Division
Office of Information Programs and Services

Congress of the United States
Washington, DC 20515

October 5, 2010

The Honorable Timothy F. Geithner
Secretary
U.S. Department of the Treasury
Chairman, Committee on Foreign Investment in the United States
c/o Mr. Aimen Mir
Director, Office of Investment Security and Staff Chairperson, CFIUS

Dear Mr. Secretary,

We are writing to express our great concerns regarding the pending sale of a uranium processing facility operated by Uranium One USA to Atomredmetzoloto, the mining arm of Rosatom, the Russian government agency that oversees Russia's nuclear industry. We believe that this transaction could threaten to impair the national security of the United States and respectfully urge the Committee to recommend the President block this transaction or postpone any action until the CFIUS has carefully evaluated the concerns outlined below and the separate Congressional review on the U.S.-Russia nuclear cooperation agreement has been completed.

On August 31, 2010, the parties announced that the ARMZ Uranium Holding Co. had purchased a controlling 51 percent interest share in Uranium One, Inc. Uranium One USA, the American subsidiary of Uranium One, Inc., operates a uranium processing facility in Wyoming. The sale could reportedly give Russia control of about 20 percent of U.S. uranium extraction capacity.

ARMZ is the successor to the world's largest uranium producer built by the Soviet Union. ARMZ is the primary supplier of uranium feedstock to the Russian nuclear industry. ARMZ is wholly owned by Rosatom, which accounts for one-fifth of the new reactors under construction worldwide and 17 percent of global nuclear fuel fabrication.

Rosatom's specific activities -- and the context within which it operates in Russia -- should raise very serious concerns for United States national security interests.

Rosatom is a state-owned entity, overseen by a government that has shown little if any inclination to effectively address the widespread and continuing corruption within Russia, particularly its energy sector.

Moreover, Rosatom has been engaged in a series of on-going and potential civilian nuclear activities that should raise red flags in the consideration of the purchase of Uranium One by the Rosatom subsidiary ARMZ:

Russia's Rosatom trained Iranian scientists and designed and built Iran's Bushehr nuclear power plant, which became operational in August, 2010. Russia now supplies this nuclear plant at Bushehr with enriched-uranium fuel rods and then is to remove the spent fuel rods that could otherwise be used to make weapons-grade plutonium.

In 2007, Rosatom signed an agreement to help build nuclear facilities in Burma and train Burmese scientists, despite U.S. concerns about the Burmese regime. A State Department spokesman at the time said the following with regard to that agreement: "We would be concerned about the possibility for accidents, for environmental damage, or for proliferation simply by the possibility of fuel being diverted, stolen or otherwise removed."

Despite criticism by environmental and nonproliferation experts, Rosatom has launched a program to build and sell floating nuclear power plants to countries around the world, with little demonstrated intent or capability to protect those floating reactors from attack or theft of nuclear materials or from accidents that could have devastating and widespread impact. With regard to proliferation, some observers are concerned over the possibility that, by operating such a floating reactor far from its soil, a host nation might be able to bypass the proliferation guidelines of the Nuclear Suppliers Group and the International Atomic Energy Agency.

It is our understanding that the US Department of State itself has this year warned that the expansion of Russia in the area of nuclear energy could involve the appearance of new danger zones in the world.

Further, in a 2007 report on nuclear nonproliferation, the General Accounting Office noted that despite the US Department of Energy's provision of access by Russian officials to sensitive nuclear sites in the United States, Rosatom "denied [GAO's] request for access to facilities...[and] denied DOE proposals for upgrading the sites including proposals with less intrusive access requirements, and informed DOE that it is not interested in pursuing [Materials Protection, Control and Accounting] MPC&A cooperation at these sites."

Russian entities are of particular concern with regard to foreign control of U.S. nuclear-related assets.

Since 1998, at least 19 different Russian entities have been placed under proliferation-related sanctions on over 20 different occasions. Indeed, a 2009 report by the Director of

National Intelligence to Congress stated that Russian entities continue to sell technologies and components in the Middle East and South Asia that are dual use and could support WMD and missile programs. Additionally, the Department of Commerce lists eight Russian entities subject to license requirements for proliferation-related end-use or end-user controls, five of which are under "presumption of denial."

In addition to the Bushehr nuclear plant, Russia has also indicated its interest in building further nuclear reactors in Iran. This cooperation has caused great distress that it could advance Iran's nuclear ambitions, be it through the extraction of weapons-grade plutonium from the reactor or the use of Bushehr (and any future additional reactors) as a cover for the prohibited transfer of other sensitive technology. It has also undermined longstanding efforts to compel Iran to abandon its pursuit of nuclear weapons.

Although Uranium One USA officials are reportedly skeptical that the transaction would result in the transfer of any mined uranium to Iran, we remain concerned that Iran could receive uranium supplies through direct or secondary proliferation.

However, the potential threat to U.S. security interests posed by the proposed transaction involving ARMZ (Rosatom) is not limited to Iran.

In May of this year, Russian President Dmitri Medvedev and Syrian leader Bashar al-Assad announced they were discussing future Russia-Syria nuclear cooperation.

Months later, in a report issued in September, the International Atomic Energy Agency (IAEA) stated that Syria continues to block its inspection of the nuclear facility destroyed by an Israeli airstrike in 2007 that had been built by North Korea for use in Syria's nuclear weapons program. Russia's eagerness to begin nuclear cooperation with Syria in these circumstances can only be seen in Damascus as strong backing for its nuclear ambitions, which is similar to the support Russia has given to Iran's nuclear program. The facilities, materials, technology, and expertise that could be provided to Syria, even for a "peaceful" program, would likely be used for a renewed weapons program, regardless of any assurances the Russians might provide. Russia's support for Syria's nuclear ambitions raises particular proliferation concerns given Syria's status as a country of proliferation concern and a state sponsor of terrorism.

These are just a few of the national security concerns that have prompted strong opposition to the proposed U.S.-Russia nuclear cooperation agreement (123 Agreement) now under consideration by Congress. The agreement cannot be defended on its merits. Both, the Bush and Obama administrations, have been unable to certify that Russian officials, individuals, and organizations are not still assisting Iran's nuclear program, as has occurred on many occasions over the past two decades. That agreement has yet to be approved and may need to be taken up again in the next Congress, where it is likely to be subjected to much greater scrutiny and potential corrective action.

We believe the take-over of essential U.S. nuclear resources by a government-owned Russian agency, as would occur under the proposed transaction, would not advance the national security and interests of the United States. We urge the Committee to recommend the President block this transaction. In the alternative, we ask the Committee to consider postponing any action on the transaction involving Uranium One, Inc. and ARMZ until the Congressional review on the U.S.-Russia nuclear cooperation agreement has been completed.

We appreciate the opportunity to share our views and concerns with you.

Sincerely,

RELEASE IN FULL

Russian Nuclear Cooperation with Iran

The United States has received assurances from Russia at the highest levels that its government would not tolerate cooperation with Iran in violation of its UN Security Council obligations, particularly those enumerated in UN Security Council Resolutions (UNSCR) 1737, 1747, and 1803. Then-Russian President Putin signed a decree on 28 November 2007 to implement fully UNSCRs 1737 and 1747.

Russia's nuclear cooperation with Iran dates back to the mid-1990s. It began during a time of great economic turmoil in Russia, and was seen as a mechanism for bringing in much needed foreign currency. This cooperation is focused on the construction of Unit 1 of the Bushehr Nuclear Power Plant (BNPP), a 1,000 MW(e) light water power reactor. Construction of this reactor and an identical reactor (Unit 2) first began in 1975, prior to the Islamic Revolution in Iran, by the West German firm Kraftwerke Union (KWU). However, work on the project was halted when the Iranian revolution began in 1979. During the 1980-1988 Iran-Iraq War, both of the incomplete reactors were targeted by Iraqi military strikes and severely damaged.

At the end of the war, Iran solicited bids to repair and finish both reactors. In 1995, Russia and Iran signed an agreement worth approximately \$800 million, according to press reports at the time, to complete the construction of the first unit of the BNPP. Additional light water power reactors were also discussed, including finishing the second unit of the BNPP, though only the first unit has been put to a contract.

Since the conclusion of the 1995 contract, the United States made its concerns with respect to the BNPP project known both publicly and privately to the Russian Government. The United States also has stressed to the Russian Government the U.S. view that no discussion of new reactors at Bushehr should commence until the international community's concerns with respect to Iran's nuclear program are satisfied. Those concerns led the United States to inform Russia that the United States would not be in a position to negotiate or conclude an Agreement for Cooperation in the Peaceful Uses of Nuclear Energy until the U.S. and Russian positions on Iran's nuclear program converged. This view continued in the early part of the Bush Administration, the policy of which was to press Russia on steps that should be taken to reduce the inherent proliferation risk presented by providing a nuclear reactor to Iran.

In that light, the United States advocated the establishment of unique measures that would minimize the latent proliferation threat of this reactor. Particular measures include: just-in-time delivery of fresh fuel to prevent the stockpiling of nuclear fuel at the reactor; and fresh fuel delivery and spent fuel take-back that both eliminate the necessity for Iran to possess the complete nuclear fuel cycle as well as ensure that spent fuel containing plutonium that could be used in nuclear weapons spends the minimum necessary time in Iran. Russia responded positively to these views, including by incorporating the fresh fuel delivery and spent fuel take-back provisions in a Russian-Iranian agreement of 28 February 2005. The United States also engaged Russia in a dialogue about the safeguards system at the BNPP and on efforts to ensure that the risk of nuclear material diversion from the plant is mitigated; to that end, the United States has encouraged Russia to work with the IAEA and Iran to conclude a facility-specific safeguards agreement (called an "INFCIRC/66" agreement) for the BNPP so as to have something in place in the event Iran makes good on its occasional threat to withdraw from the NPT. A facility-specific safeguards agreement of this type would provide a legal basis for safeguards in perpetuity at BNPP in that event.

The United States also expressed concern that the BNPP project could be used by Iran to obtain equipment, materials, and technology of serious proliferation significance under the guise of this civil use of nuclear energy. To that end, we have stressed to Russia the importance of conducting comprehensive and thorough reviews of any attempt to export nuclear or dual-use technology to Iran to ensure that the intended end user is legitimate and will only use the item in question in activities that are not of proliferation concern. The United States has echoed this call in its engagement with international partners worldwide. In recognition of this risk, the UN Security Council, through the adoption of UNSCRs 1737 in December 2006 and then 1803 in March 2008, which were reaffirmed by Resolution 1835 in September 2008, significantly restricted the transfer of NSG-controlled nuclear and dual-use items to Iran.

Construction of the BNPP was to be completed in 2001, but the deadline has been moved back several times as a result of the difficulty of adapting the original West German design and technology to meet Russian specifications; issues between Russia and Iran, including financial issues between the Russian contractors and the Iranian government; and third party supply problems. In September 2006, the Russian and Iranian governments announced that they would complete the construction of the reactor in 2007 with the first core-load of reactor fuel to be delivered by March 2007 and the reactor coming on-line in September 2007. In February and March of 2007, Russia noted that, due to Iran's failure to

provide adequate payment on the agreed-upon schedule and to continued third party supply problems, the first shipment of nuclear fuel would be delayed indefinitely; however, Russia pledged its commitment to the project. After some success in resolving both of these issues, on December 16, 2007 Russia began shipping the first core-load of nuclear fuel to Bushehr; these shipments were completed by the end of January 2008. Within the context of the steps taken by Russia to strengthen the nonproliferation measures associated with the Bushehr reactor, the United States supported Russia's delivery of nuclear fuel to Bushehr as a clear demonstration that Iran does not need to possess the full nuclear fuel cycle--and, in particular, uranium enrichment -- in order to enjoy the peaceful uses of nuclear energy. In late February 2009, Iran started reactor tests at BNPP using simulated fuel rods made of lead instead of uranium. Sergey Kiriyenko stated that the construction phase was over, and Iran was starting on the pre-commissioning stage. In late March 2010, Kiriyenko confirmed plans to launch the BNPP by late in the summer of this year.

Russia has also supported the IAEA's intense investigation into Iran's nuclear program, including by supporting the November 2009 Board of Governors resolution condemning Iran's construction of an illicit enrichment facility near Qom in violation of its obligations under UN Security Council Resolutions to suspend all enrichment-related activities; increasing pressure on Tehran to comply with its obligations, including through the adoption of UN Security Council Resolutions 1696 (July 2006), 1737 (December 2006), 1747 (March 2007), 1803 (March 2008), and 1835 (September 2008) with three imposing Chapter VII sanctions; and the offers in June 2006 and June 2008 to Tehran to entice the regime to suspend its proliferation sensitive nuclear activities and engage in negotiations on the future of its nuclear program.

In June 2009, the Iranian government requested the IAEA's assistance in providing fuel for the Tehran Research Reactor (TRR) so that it could continue the operation of the reactor to produce medical isotopes beyond the depletion of its fuel supply, which Iran said would be at the end of 2010. The IAEA, in consultation with the United States and Russian governments (among others), developed a proposal to respond positively to Iran's request, while recognizing that Iran remains in violation of its international obligations under UNSCRs, the IAEA, and the NPT.

In light of Russia's demonstrated willingness, as outlined above, to work together with the United States and other nations to seek a resolution of the issues raised by Iran's nuclear program, the United States entered into negotiations with

Russia in October 2006 on the U.S.-Russia agreement for peaceful nuclear cooperation to which this NPAS relates. Negotiations were essentially completed in April 2007. A Nuclear Proliferation Assessment Statement and classified annex ("2008 NPAS") were prepared and submitted to the President with a recommendation that he approve the Agreement and authorize its execution, determine that the performance of the proposed Agreement will promote, and will not constitute an unreasonable risk to, the common defense and security. The Agreement was approved and its execution authorized by Presidential Determination 2008-19 (May 5, 2008), and the Agreement was signed on May 6, 2008. On May 13, 2008, President Bush transmitted the Agreement to Congress for review, together with the Nuclear Proliferation Assessment Statement and classified annex. As noted above, on September 8, 2008, prior to the completion of the review period of 90 continuous session days, he sent a message to Congress informing it that "in view of recent actions by the Government of the Russian Federation incompatible with peaceful relations with its sovereign and democratic neighbor, Georgia," he had determined that his earlier determination (i.e., regarding performance of the Agreement) was no longer effective. He further stated that if circumstances should permit future reconsideration by Congress, a new determination would be made and the proposed Agreement resubmitted for congressional review.

In May 2010, President Obama transmitted to Congress for review the text of the Agreement signed in May 2008. The United States and Russia have made significant accomplishments in our bilateral nonproliferation relationship over the past 12 months. We also maintain that the level and scope of U.S.-Russia cooperation on Iran were sufficient to justify re-submitting the proposed Agreement to Congress once again.

RELEASE IN FULL

NUCLEAR PROLIFERATION ASSESSMENT STATEMENT

**Pursuant to Section 123 a. of the
Atomic Energy Act of 1954, as Amended,
With Respect to the Proposed Agreement Between the
Government of the United States of America and the
Government of the Russian Federation
For Cooperation in the Field of Peaceful Uses of Nuclear Energy**

INTRODUCTION

This Nuclear Proliferation Assessment Statement (NPAS) relates to the proposed Agreement Between the Government of the United States of America and the Government of the Russian Federation for Cooperation in the Field of Peaceful Uses of Nuclear Energy (the Agreement). The Agreement is being submitted to the President jointly by the Secretary of State and Secretary of Energy for his approval and authorization for signature.

Section 123 a. of the Atomic Energy Act, as amended (the Atomic Energy Act or Act), provides that an NPAS be submitted by the Secretary of State to the President on each new or amended agreement for cooperation concluded pursuant to that section. Pursuant to section 123 a., the NPAS must analyze the consistency of the text of the proposed agreement with all the requirements of the Act, with specific attention to whether the proposed agreement is consistent with each of the criteria set forth in that subsection, and address the adequacy of the safeguards and other control mechanisms and the peaceful use assurances contained in the agreement for cooperation to ensure that any assistance furnished thereunder will not be used to further any military or nuclear explosive purpose.

With this statutory mandate in mind, this NPAS: (a) provides background information on the Russian civil nuclear program, on the nonproliferation policies of the Russian Federation including collaboration with the United States on important nonproliferation initiatives, and on existing Russian civil nuclear cooperation with the United States (Part I); (b) describes the nature and scope of the cooperation contemplated in the proposed Agreement (Part II); (c) reviews the applicable substantive requirements of the Act and the Nuclear Non-Proliferation Act of 1978 (NNPA) and details how they are met by the proposed Agreement (Part III); and (d) sets forth the net assessment, conclusions, views, and

UNCLASSIFIED

UNCLASSIFIED

- 2 -

recommendations of the Department of State as contemplated by section 123 a. of the Act (Part IV).

L. Background on Russia's Civil Nuclear Program, Non-Proliferation Policies and Practices, and Current Civil Nuclear Cooperation with the United States

The Nuclear Fuel Cycle in the Russian Federation

After the dissolution of the Soviet Union in December 1991, the Russian Federation (Russia) inherited 80 percent of the former Soviet Union nuclear complex, which included both military and civilian institutions and facilities. In 1992, the Ministry for Atomic Energy (MinAtom) succeeded the Soviet Ministry of Atomic Power and Industry. As a result of government restructuring, MinAtom became the Federal Atomic Energy Agency (FAEA, known as Rosatom) in 2004, responsible for all nuclear industry and accountable directly to the President despite being stripped of its ministerial title.

On December 3, 2007, President Putin signed the federal law to convert Rosatom from a federal agency to a government-owned corporation. The new corporation is responsible for both the civilian and defense nuclear programs, and for the implementation of government policy in the nuclear arena. On December 12, 2007, Sergei Kiriyenko was appointed the head of the new Rosatom Corporation.

Rosatom is divided into several branches, including the primary technical branches: Nuclear Weapons Complex; Nuclear Power; Nuclear Science and Technology; and Nuclear Safety. The Nuclear Weapons Complex is divided into two primary divisions: Development and Testing, and Nuclear Weapons Production. The Development and Testing division includes two major design centers – the All-Russian Scientific Research Institute for Experimental Physics in Sarov and the All-Russian Scientific Research Institute for Technical Physics in Snezhinsk; five research institutes – the All-Russian Scientific Research Institute of Automatics in Moscow, the All-Russian Scientific Research Institute of Measuring Systems in Nizhniy Novgorod, the All-Russian Scientific Research Institute of Pulse Technology in Moscow, the Design Bureau of Automotive Transport Equipment in Mytishchi-7, Moscow, and the All-Russian Scientific Research Institute of Strategic Stability in Moscow; and Expedition No. 2 Novaya Zemlya, a mining enterprise at the Central Test Site on Novaya Zemlya in the Arkhangelsk region.

UNCLASSIFIED

UNCLASSIFIED

- 3 -

The Nuclear Weapons Production division of Rosatom includes two nuclear weapons production plants – Elektrokhimpribor Combine in Lesnoy and the Instrument-Making Plant in Trekhgomyy; a fissile material production site – Mayak Production Association in Chelyabinsk; and several component manufacturing sites including the Urals Electromechanical Plant in Yekaterinburg, the Sever Production Association in Novosibirsk, the Start Production Association in Zarechnyy, and the Bazalt Company in the Saratov region. Russia has reduced the overall number of sites that work on nuclear weapons manufacturing but has continually maintained its technical, production, and test capabilities.

Russia's civilian nuclear industry covers every stage of the nuclear fuel cycle, including uranium mining, milling, conversion, enrichment; uranium and mixed-oxide (MOX) fuel fabrication; spent fuel storage; reprocessing; and waste management.

Rosatom is seeking to increase its uranium mining capacity, which was limited after the break-up of the Soviet Union. Russia has reestablished collaboration in this area with former Soviet states such as Kazakhstan, Kyrgyzstan, Ukraine, and Uzbekistan. To further secure its access to uranium reserves, Russia is pursuing cooperation with countries beyond the former Soviet Union such as Australia, Canada, South Africa, Namibia, and Brazil. The Priargunsky Industrial Mining and Chemical Association in Russia currently mines approximately 3,500 tons of uranium annually. Russia hopes to increase output of its mines to 7,500 tons/year by 2020.

Russia possesses substantial recoverable resources of uranium, with approximately 5 percent of the world's reasonably assured resources. Russia holds a sizeable stockpile of low enriched uranium (LEU) and highly enriched uranium (HEU), which it relies upon to meet its domestic and international needs in the commercial nuclear power sector.

Russia operates four enrichment plants totaling approximately 24 million kg separative work units/year, located in Novouralsk, Zelenogorsk, Angarsk, and Seversk. The facilities at Novouralsk and Zelenogorsk service foreign demand for enriched uranium. The Angarsk and Seversk facilities specialize in enrichment of reprocessed uranium.

In 2006, Russia announced the creation of the International Uranium Enrichment Center (IUEC), which will be a privately-held multi-national venture

UNCLASSIFIED

UNCLASSIFIED

- 4 -

located at the Angarsk Electrochemical Combine. Russia will maintain a majority share of the IUEC. The center is intended to help Russia increase its market share as a supplier of enriched uranium and uranium enrichment services to the international nuclear market. Russia has stated that establishment of the IUEC will reduce the risk of nuclear proliferation by allowing a limited number of countries to maintain control of the uranium enrichment services while making the facility available to countries that need the enrichment capacity but without access to the enrichment technology itself. The facility has been placed on Russia's list of facilities eligible for International Atomic Energy Agency (IAEA) safeguards.

Nuclear fuel fabrication is carried out at two plants – Elektrostal and Novosibirsk – with a combined capacity of 2,600 tons of heavy metal per year. The plant at Elektrostal produces fuel assemblies for both Russian and European reactors using fresh and recycled uranium and is the principal exporter of fuel assemblies. The plant at Novosibirsk produces fuel for the VVER-440 and -1000 reactors. Russia plans to upgrade fuel production capabilities and modernize some of the lines and techniques. Upgrades worth \$200M are planned from 2007-2015.

At the time of this NPAS, Russia was operating 31 civilian nuclear power reactors with a total capacity of 21,743 megawatt electric. Until recently, it had also been operating three plutonium production reactors, two in Seversk and one in Zheleznogorsk. However, one of the Seversk production reactors was shut down on April 20, 2008, and the other is scheduled to be shut down on June 5, 2008. This will end production of up to one-half ton per year of weapon-grade plutonium at each of the two reactors. The Agreement Between the Government of the United States of America and the Government of the Russian Federation Concerning Cooperation Regarding Plutonium Production Reactors, signed at Moscow September 23, 1997, as amended (PPRA) calls for the remaining production reactor at Zheleznogorsk to cease operation by the end of 2010.

Rosatom officials have publicly stated their intention to increase total domestic electricity generated by nuclear power from 16 percent to 23 - 25 percent by 2030. To that end, Rosatom has announced its intention to construct 10 new nuclear power plants by 2015 with 42 new reactors to be completed by 2030. Russia has said publicly that fast breeder reactors and MOX fuel will be the foundation of its nuclear program from 2020-2022 and beyond. In addition, Russia is focusing on floating reactors to provide power to remote regions.

Russia is also focused on extending the lifetime and improving the operation of existing reactors with higher quality fuels and greater efficiency in operation.

UNCLASSIFIED

UNCLASSIFIED

- 5 -

For example, in the case of the BN-600 fast breeder reactor currently operating at Beloyarsk, improved efficiencies have stretched the period between refueling to as much as 560 days.

Russia continues to reprocess spent fuel from the three plutonium production reactors at Seversk and Zheleznogorsk. The Mayak Production Association RT-1 facility was designed to reprocess up to 400 MT per year but currently operates at about a third of capacity. Reprocessing is critical to the Russian nuclear power program because it provides reprocessed uranium and reactor-grade plutonium that can be used in fast breeder reactors. Russia has announced that it plans to build a pilot scale facility for reprocessing VVER-1000 spent nuclear fuel at Zheleznogorsk and a full-scale reprocessing plant with up to 3,000 tons/year in the future.

Currently, an interim spent fuel storage facility is in operation in Zheleznogorsk and it is being expanded to accommodate more material. The Mining and Chemical Combine in Zheleznogorsk may become a permanent disposal site, as a dry storage facility is being constructed there.

The potential co-location of a spent fuel storage facility and a reprocessing plant in Zheleznogorsk could make it an attractive site for storage of foreign spent fuel. Recently passed laws allow for the import of foreign spent fuel, but it is not clear whether Russia intends to pursue this. In July 2006, Rosatom officials declared that Russia would not import foreign spent fuel other than the VVER-440 and VVER-1000 spent nuclear fuel it currently receives from Ukraine, Bulgaria, and other countries. The stated goal of the Russian government to expand its integrated nuclear services, however, may include acceptance of spent nuclear fuel from Russian-supplied nuclear plants in the future. Russia plans to accept spent nuclear fuel from Iran if the Russian-built power reactor in Bushehr becomes operational.

Restructuring of Russia's Nuclear Industry

Reform of Russia's nuclear industry began with the appointment of Sergey Kiriyenko as Director of Rosatom in 2005. Upon his appointment, Kiriyenko replaced officials in several important positions in an effort to implement Rosatom's goals more efficiently. In June 2006 President Putin approved and signed the concept for the restructuring of Russia's nuclear industry with the goals of expanding both its domestic nuclear capacity and its export of nuclear power reactors and services.

UNCLASSIFIED

UNCLASSIFIED

- 6 -

The civilian nuclear program within Russia is being completely reoriented consistent with Russia's overall energy strategy. During 2006, a number of key funding documents were developed and approved. Rosatom is undergoing a large reorganization to support the Russian government plans to expand nuclear power both domestically and internationally, thereby establishing Russia as a world leader in the nuclear market. The budget for the total program is 1,471 billion rubles (approximately \$55.5 billion). Of this figure, about 674.8 billion rubles comes from the federal budget and the remainder is made up by the nuclear sector through a variety of means.

A series of comprehensive laws and decrees has been proposed or passed that are intended to increase state control and profitability of Russia's nuclear industry. President Putin has publicly stated a goal of completing the restructuring in 2008. The speed with which much of the legislation has been introduced and passed indicates that the reforms are a top priority for the government and have broad support.

In October 2006, President Putin approved a program, "Development of Nuclear Power Industry Complex in Russia for 2007-2010 and Further to 2015," that outlines the future of Russia's nuclear energy complex. The program provides a comprehensive plan for investment in the Russian nuclear power industry, the lifetime extension of current nuclear plants, and the construction of new nuclear plants within Russia and abroad.

On January 24, 2007, the Russian legislature – the lower and upper houses together – passed the bill commonly referred to as the "Tunnel Law," outlining the future legal changes that would be necessary to achieve the overall restructuring of the civil nuclear industry, as well as creating the legal basis for a new vertically-integrated holding company – Atomnyy Energopromyshlennyy Kompleks, popularly known as "Atomenergoprom" or "Atomprom," – that would act as a management company bringing together the various entities involved in the civilian nuclear sector.

The creation of Atomenergoprom is the cornerstone of the reform efforts; it will control products and services associated with every stage of the civil nuclear fuel cycle, ranging from uranium mining to the construction and management of nuclear power plants and reprocessing. The restructuring will also establish two primary branches under Rosatom – the nuclear power branch, which will be open

UNCLASSIFIED

UNCLASSIFIED

- 7 -

to international and industry standards, and the nuclear weapons branch, which will maintain a closed defense posture.

On February 6, 2007, President Putin signed the restructuring bill, thereby making it a federal law to allow private entities to own nuclear materials, installations, and facilities. Of significance, the bill recognizes the rights of foreign states to retain ownership over material processed in Russia. This change should facilitate the operation of the Angarsk IUEC joint-venture between Russia, Kazakhstan, and other potential partner nations.

The law also will result in the conversion of 55 state owned institutes into joint stock companies in which the Russian state owns the majority or all of the stock. This change is significant and critical to implementing the nuclear power program since it will allow Atomenergoprom and the associated businesses and institutes to work as private companies while continuing under government ownership. In addition, Russia is repurchasing critical industrial manufacturing companies within Russia to ensure the success of their nuclear expansion.

Finally, on 3 December 2007, President Putin signed the law establishing the State Atomic Corporation Rosatom, which changes the current Federal Atomic Energy Agency (also called Rosatom) into a corporation uniting all enterprises of the Russian civilian and military nuclear industry. The State Corporation will consist of civilian, military, research, and safety/waste management subdivisions. The reform took effect in the first quarter of 2008.

This reform does not envision any structural changes for the nuclear weapons complex. Mr. Kiriyyenko has stated that the federal budget is adding 60 billion rubles for nuclear armaments, and it may add an additional 38 billion rubles to "military atomic industry development."

In early February 2008, Mr. Kiriyyenko was officially removed from his position heading the Rosatom Agency to take his position as the head of the Rosatom State Corporation. A newly established joint stock company, JSC Atomenergoprom, now controls commercial activities including nuclear power generation, nuclear engineering, and the front end of the fuel cycle. Rosatom Corporation, a successor of the Rosatom agency, retains control of defense related work, nuclear science, the back end of the fuel cycle, and nuclear safety.

Federal accounting control for nuclear material and IAEA safeguards would continue to be managed by Rosatom as a government-owned corporation. To meet

UNCLASSIFIED

UNCLASSIFIED

- 8 -

its domestic and international obligations for nuclear safety and security Rosatom has established a Federal Target Program for Nuclear and Radiation Safety from 2008 through 2015, funded at approximately \$5.5 billion. This funding will cover environmental cleanup, decommissioning of facilities, and spent nuclear fuel reprocessing. Rosatom has established the importance of expanding its nuclear materials control program as key to gaining international credibility for its nuclear programs. Consistent with this goal, Rosatom has established a new branch or department that will be responsible for its civilian and nuclear materials.

Division between Russia's Civil and Military Nuclear Complexes

The "Tumel Law" calls for the separation of the civil and defense sectors of the Russian nuclear complex and identifies the enterprises that will become joint stock companies under Atomenergoprom. Fifteen facilities were excluded from the restructuring due to their "strategic" value. These facilities, listed below, serve critical roles in the design, testing, and manufacture of nuclear weapons within Russia. Also listed below are six mixed civil-military facilities, portions of which will need to be transferred to military entities to facilitate the privatization of the remaining civilian components.

Strategic Facilities Prohibited from Privatization:

- N.L. Dukhov All-Russian Scientific Research Institute of Automatics (VNIIA), Moscow
- Research Institute of Pulse Technique, (NIIT), Moscow
- Institute of Strategic Stability, Moscow
- Design Bureau of Automotive Transport Equipment, Mytishchi, Moscow Region
- Ural Electromechanical Plant, (UEMZ), Yekaterinburg
- Elektrokhimpribor Combine Plant, Lesnoy, Sverdlovsk Region
- Sever Industrial Association, Novosibirsk
- All-Russian Scientific Research Institute of Measuring Systems (NIIS), Nizhniy Novgorod
- Russian Federal Nuclear Center – All-Russian Research Institute of Experimental Physics (VNIIEF), Sarov, Nizhniy Novgorod Region
- "Start" Production Association, Zarechnyy, Penza Region
- Bazalt Company, Raskov village, Saratov region
- Mayak Production Association, Ozersk, Chelyabinsk Region

UNCLASSIFIED

UNCLASSIFIED

- 9 -

- Russian Federal Nuclear Center – E.I. Zababakhin All-Russian Scientific Research Institute of Technical Physics (VNIITF), Snezhinsk, Chelyabinsk Region
- Instrument Making Plant, Trekhgornyy, Chelyabinsk Region
- Expedition #2, Novaya Zemlya Island, Arkhangelsk Region

Mixed Civil-Military Facilities:

- Gidropress Experimental Design Bureau, Podolsk, Moscow Oblast
- Siberian Chemical Combine, SCC, Seversk, Tomsk Oblast
- N.A. Dollezhal Research and Development Institute of Power Engineering, NIKIET, Moscow
- Bochvar All-Russian Scientific Research Institute for Inorganic Materials, VNIINM, Moscow
- Krasnaya Zvezda (Red Star) State Enterprise, Moscow
- I.I. Afrikantov Experimental Design Bureau for Machine Building, OKBM, Nizhniy Novgorod

Details have not been made public on how Russia will separate the civil and nuclear facilities, particularly in relation to research centers, which have historically performed work for both sectors, but the President will retain power to determine which facilities remain in the defense sector.

IAEA Safeguards in Russia

In February 1985, the Soviet Union signed a Voluntary Offer Agreement with the IAEA regarding the application of safeguards in the Soviet Union. This agreement is still in force between the Russian Federation and the IAEA. The agreement gives the IAEA the right to apply safeguards on all source or special fissionable material at peaceful nuclear facilities on a list provided by the Soviet Union (now Russian Federation), with a view to enabling the IAEA to verify that such material is not withdrawn from those facilities while under safeguards, except as provided for in the agreement.

As a nuclear weapons state, Russia is not required to place its nuclear activities under IAEA safeguards. To date, Russia has offered to place only some facilities – several power stations and nuclear research reactors, and the newly created IUEC – on its list of designated facilities eligible for IAEA safeguards. To date, none has been selected by the IAEA for the application of safeguards.

UNCLASSIFIED

UNCLASSIFIED

- 10 -

In March 2000, Russia also signed with the IAEA an Additional Protocol to the safeguards agreement, which was ratified by the Russian State Duma and the Federation Council in September 2007. It entered into force October 16, 2007. Development of the Model Additional Protocol was initiated in response to the discovery of Iraq's nuclear weapons program in the early 1990s. Additional Protocols are intended to ensure that no State has undeclared nuclear material or activities. As is its right as a nuclear-weapons state, Russia chose to conclude an Additional Protocol that is considerably more limited than the Model Additional Protocol.

Russia's Nuclear Nonproliferation Policies and Practices

Russia is a Nuclear Weapon State Party to the Non-Proliferation Treaty (NPT). It subscribes to the Zangger (NPT Exporters) Committee Guidelines, which harmonize supplier implementation of the NPT requirement for the application of IAEA safeguards on nuclear exports to Non-Nuclear Weapon States, and to the Nuclear Suppliers Group (NSG) Guidelines, which set forth guidelines for the export of nuclear equipment, materials, and technology for peaceful use to be followed by NSG members.

The Russian Federation is cooperating with the United States to promote a number of important initiatives aimed at reducing the risk of nuclear proliferation worldwide. Among these are the following:

- Russia is supporting the initiative known as Reliable Access to Nuclear Fuel (RANF), to develop, in conjunction with other major nuclear fuel suppliers and the IAEA, an international mechanism whereby countries that choose to purchase enriched uranium reactor fuel on the international market in lieu of developing enrichment and reprocessing capabilities of their own and that adhere to agreed nuclear nonproliferation criteria would have reliable access to reactor fuel in the event of an unforeseen disruption in commercial arrangements.
- Russia and the United States issued a Joint Declaration on Nuclear Energy and Nonproliferation in July 2007, in which Presidents Bush and Putin stated their intention to work together and with others to develop a viable alternative to the acquisition of sensitive fuel cycle technologies. This would be presented through the development of an attractive offer to encourage pursuit of nuclear energy without indigenous nuclear fuel cycles.

UNCLASSIFIED

UNCLASSIFIED

- 11 -

- Russia has created the IUEC, which the United States regards as potentially an important element of RANF.
- Russia has been working jointly with the United States to develop LEU fuel for use in U.S.- and Russian-designed research reactors in third countries now using HEU fuel, as well as to repatriate fresh and spent HEU fuel from U.S.- and Russian-designed research reactors in third countries. In this connection, the two countries collaborated on the delivery to Libya in January 2006 of replacement Russian LEU fuel to Libya's Russian-supplied research reactor.
- Russia continues to eliminate large stocks of weapons-grade HEU under the 1993 U.S.-Russia HEU Agreement, which will result in the down-blending of 500 metric tons of HEU to low-enriched uranium for use in U.S. civil nuclear reactors.
- The United States and Russia are also making progress through the U.S.-Russia Bratislava Initiative to accelerate security upgrades of Russian nuclear materials and nuclear facilities.
- Under the Global Initiative to Combat Nuclear Terrorism, announced by President Bush and President Putin on July 15, 2006, the two countries are working together to accelerate global cooperation in this area. The United States and Russia co-chaired the first three meetings of the Global Initiative partner nations in Rabat, Ankara, and Astana.
- Russia along with the United States, China, France, Germany, and the United Kingdom (the "P5+1") extended a generous and historic offer in June 2006 to Iran to entice the regime to suspend its proliferation sensitive nuclear activities and engage in negotiations on the future of its nuclear program. A core element of this offer was Russia's proposal for an enrichment consortium, based in Russia, in which Iran would have ownership but no access to sensitive technology. Additionally, Russia has voted in favor of four UN Security Council resolutions, three of which have imposed Chapter VII sanctions, in response to Iran's failure to comply with its international nuclear obligations.
- Russia shares the U.S. goal of achieving the complete denuclearization of the Korean Peninsula by peaceful means, and has been a constructive partner

UNCLASSIFIED

UNCLASSIFIED

- 12 -

in the Six-Party Talks. Russia supported U.S. efforts in the United Nations Security Council to secure a resolution condemning North Korea's July 2006 missile tests, and also supported a Chapter VII sanctions resolution against North Korea after its October 9, 2006 nuclear test.

In general, the Russian Government has maintained a responsible approach with respect to its civil nuclear cooperation with Non-Nuclear Weapon States. Its cooperation with a few notable states, however, has been problematic and requires particular mention.

Russian Nuclear Cooperation with Iran

The United States has received assurances from Russia at the highest levels that its government would not tolerate cooperation with Iran in violation of its UN Security Council obligations, particularly those enumerated in UNSCRs 1737, 1747, and 1803. Russian President Putin signed a decree on November 28, 2007 to implement fully UNSCRs 1737 and 1747.

Russia's nuclear cooperation with Iran dates back to the mid-1990s. It began during a time of great economic turmoil in Russia, and was seen as a mechanism for bringing in much needed foreign currency. This cooperation is focused on the construction of Unit 1 of the Bushehr Nuclear Power Plant (BNPP), a 1,000 megawatt electric light water power reactor. Construction of this reactor and an identical reactor (Unit 2) first began in 1975, prior to the Iranian Revolution, by the West German firm Kraftwerke Union. However, work on the project was halted when the Iranian revolution began in 1979. During the 1980-1988 Iran-Iraq War, both of the incomplete reactors were targeted by Iraqi military strikes and severely damaged.

At the end of the war, Iran solicited bids to repair and finish both reactors. In 1995, Russia and Iran signed an agreement worth approximately \$800 million, according to press reports at the time, to complete the construction of the first unit of the BNPP. Additional light water power reactors were also discussed, including finishing the second unit of the BNPP, though only the first unit has been put to a contract.

Since the conclusion of the 1995 contract, the United States made its concerns with respect to the BNPP project known both privately and publicly to the Russian government. The United States also has stressed to the Russian government the U.S. view that no discussion of new reactors at Bushehr should

UNCLASSIFIED

UNCLASSIFIED

- 13 -

commence until the international community's concerns with respect to Iran's nuclear program are satisfied. Those concerns led the United States to inform Russia that the United States would not be in a position to negotiate or conclude an Agreement for Cooperation in the Peaceful Uses of Nuclear Energy until the U.S. and Russian positions on Iran's nuclear program converged. This view continued through to the present Administration, the policy of which has been to press Russia on steps that should be taken to reduce the inherent proliferation risk presented by providing a nuclear reactor to Iran.

In that light, the United States advocated the establishment of unique measures that would minimize the latent proliferation threat of this reactor. Particular measures include: just-in-time delivery of fresh fuel to prevent the stockpiling of nuclear fuel at the reactor; and fresh fuel delivery and spent fuel take-back that both eliminate the necessity for Iran to possess the complete nuclear fuel cycle as well as ensure that spent fuel containing plutonium that could be used in nuclear weapons spends the minimum time necessary in Iran. Russia responded positively to these views, including by incorporating the fresh fuel delivery and spent fuel take-back provisions in a Russian-Iranian agreement of February 28, 2005. The United States also engaged Russia in a dialogue about the safeguards system at the BNPP and on efforts to ensure that the risk of nuclear material diversion from the plant is mitigated; to that end, the United States has encouraged Russia to work with the IAEA and Iran to conclude a facility-specific safeguards agreement (called an "INFCIRC/66" agreement) for the BNPP so as to have something in place in the event Iran makes good on its occasional threat to withdraw from the NPT. A facility-specific safeguards agreement of this type would provide a legal basis for safeguards in perpetuity at BNPP in that event.

The United States also expressed concern that the BNPP project could be used by Iran to obtain equipment, materials, and technology of serious proliferation significance under the guise of this civil use of nuclear energy. To that end, we have stressed to Russia the importance of conducting comprehensive and thorough reviews of any attempt to export nuclear or dual-use technology to Iran to ensure that the intended end user is legitimate and will only use the item in question in activities that are not of proliferation concern. The United States has echoed this call in its engagement with international partners worldwide. In recognition of this risk, the UN Security Council, through the adoption of resolutions 1737 and 1803 in December 2006 and March 2008, prohibited the transfer of NSG-controlled nuclear and dual-use items to Iran, unless for exclusive use in light water reactors, and imposed procedures that all states must implement should they transfer items to Iran under the light water reactor exemption.

UNCLASSIFIED

UNCLASSIFIED

- 14 -

Construction of the BNPP was to be completed in 2001, but the deadline has been moved back several times as a result of the difficulty of adapting the original West German design and technology to meet Russian specifications; issues between Russia and Iran, including financial issues between the Russian contractors and the Iranian government; and third party supply problems. In September 2006, the Russian and Iranian governments announced that they would complete the construction of the reactor in 2007 with the first core-load of reactor fuel to be delivered by March 2007 and the reactor coming on-line in September 2007. In February and March of 2007, Russia noted that, due to Iran's failure to provide adequate payment on the agreed-upon schedule and to continued third party supply problems, the first shipment of nuclear fuel would be delayed indefinitely; however, Russia pledged its commitment to the project. On December 16, 2007, Russia began shipping the first core-load of nuclear fuel to Bushehr, after some success in resolving both of these issues; these shipments were completed by the end of January 2008. Within the context of the steps taken by Russia to strengthen the nonproliferation measures associated with the Bushehr reactor, the United States supported Russia's delivery of nuclear fuel to Bushehr as a clear demonstration that Iran does not need to possess the full nuclear fuel cycle – and, in particular, uranium enrichment – in order to enjoy the peaceful uses of nuclear energy. Russia and Iran have presented some conflicting information regarding the start-up and specific date of full operational status for the reactor, but both have asserted that the reactor will come on-line in 2008.

Russia has also supported: the IAEA's intense investigation into Iran's nuclear program; increasing pressure on Tehran to comply with its obligations, including through the adoption of UN Security Council Resolutions 1696 (July 2006), 1737, 1747 (March 2007), and 1803, with the latter three imposing Chapter VII sanctions; and the offer in June 2006 to Tehran to entice the regime to suspend its proliferation sensitive nuclear activities and engage in negotiations on the future of its nuclear program.

In light of Russia's demonstrated willingness, as outlined above, to work together with the United States and other nations to seek a resolution of the issues raised by Iran's nuclear program, the United States entered into negotiations with Russia in October 2006 on the U.S.-Russia agreement for peaceful nuclear cooperation to which this NPAS relates. Negotiations were essentially completed in April 2007. On June 29, 2007, the text of the proposed Agreement was initialed at Moscow by U.S. Ambassador William Burns and Rosatom Deputy Director Nikolay Spasskiy and submitted for review in the two capitals.

UNCLASSIFIED

- 15 -

Additional details on the proliferation concerns associated with Russia-Iran cooperation and efforts to mitigate them are presented in the classified annex to this NPAS.

Russian Nuclear Cooperation with India

Russia is cooperating with India in the construction of two VVER-1000 power reactors for India's Kudankulam Atomic Power Project. Construction delays have pushed back commissioning until late 2008 or 2009. Russia maintains that this cooperative activity is pursuant to a pre-April 3, 1992 agreement between the former Soviet Union and India, and is therefore "grandfathered" under paragraph 4(c) of the NSG Guidelines from the requirement for full-scope IAEA safeguards (FSS) as a condition for supply of Trigger List items to non-nuclear weapon states such as India. During a January 25-26, 2007 visit to New Delhi by President Putin, the Russian and Indian sides signed a Memorandum of Intent to construct four additional power reactor units at Kudankulam, contingent on an NSG decision (in the context of the U.S.-India Civil Nuclear Cooperation Initiative) to make an exception to the FSS requirement for supply to India.

Since 2001, Russia has also been supplying LEU fuel for India's two U.S.-supplied power reactors at Tarapur. (The U.S. fuel supply was terminated in 1980 following passage of the NNPA, which established FSS as a U.S. export condition for such supply to non-nuclear weapon states, a condition that India, as noted in the preceding paragraph, does not satisfy.) Russia has argued that its supply is consistent with the NSG guidelines. It bases its argument on a provision of the Guidelines that permits supply in exceptional cases when the transfer is deemed essential for the safe operation of existing facilities and safeguards are applied to those facilities. (The Tarapur reactors themselves are under IAEA safeguards, even though India has not accepted full-scope IAEA safeguards.) The United States and nearly all other NSG Participating Governments disagree with the Russian view that the safety exception justifies fresh fuel supply to Tarapur.

If the NSG were to decide by consensus to make an exception to the Guidelines to permit the transfer of Trigger List items to India under safeguards but in the absence of FSS, as envisaged by the July 18, 2005 Joint Statement of President Bush and Prime Minister Manmohan Singh and by the Hyde Act, this would eliminate any question concerning the legitimacy under the Guidelines of Russia's current supply arrangements with India.

Russian Nuclear Cooperation with Burma

On May 15, 2007, Russia's Rosatom and the Ministry of Science and Technology of Myanmar (hereafter referred to as "Burma") signed in Moscow an agreement on the creation of a nuclear research center to include construction of a 10 MW light-water nuclear research reactor in Burma. According to Rosatom's press statement, the reactor will be fueled with uranium enriched to a level "not exceeding" 20 percent. The facility, which will be placed under IAEA safeguards, is intended to help Burmese research in nuclear physics, biotechnology, and material science, as well as to produce medicines. The cooperative agreement also envisions nuclear training in Russia of over three hundred Burmese technicians and scientists to work at the research center.

The United States has on multiple occasions communicated to Russia and to U.S. partners in East and Southeast Asia that it believes the development of nuclear infrastructure of any kind in Burma to be inappropriate, given the current situation in that country. Burma lacks an adequate administrative, legal, technical, financial, and regulatory infrastructure necessary for safe and secure operation of a nuclear reactor. In particular, Burma lacks a national nuclear regulatory authority or a state system of nuclear material accounting and control. Burma is not a party to the Convention on the Physical Protection of Nuclear Material and has not made political commitments to follow the IAEA Code of Conduct on Safety and Security of Radioactive Sources or the Guidance on the Import and Export of Radioactive Sources as IAEA General Conference resolutions have urged all States to do. In addition, Burma does not have in place legislation, procedures, measures, or agencies for basic border control or export/import controls relating to transfers of nuclear and nuclear-related material, equipment, and technology. In the view of the United States, the risk of proliferation, accident, sabotage, misapplication, or diversion of nuclear and nuclear-related material, equipment, and technology is unacceptably high. The United States continues to advise Russia, and other countries as well, on the inadvisability of nuclear cooperation with Burma.

Russia and Burma reportedly first concluded a bilateral nuclear agreement in 2002, though implementation was delayed due to Russian concerns that Burma was unable to cover the advance costs of the facility's construction. In 2003, Moscow informed the IAEA that it planned to provide training in nuclear science to about 300 Burmese citizens per year. According to Burmese government officials, more than 1,000 scientists, technicians, and military personnel have received nuclear training in Russia over the past six years.

UNCLASSIFIED

UNCLASSIFIED

- 17 -

The agreement announced May 15, 2007, provides merely a framework for nuclear cooperation between Russia and Burma and includes no details regarding site, costs, and logistics of constructing the center, or any details regarding nuclear training to be provided. Specifics regarding implementation of the agreement remain subject to negotiation between Russia and Burma. Russian authorities have asserted publicly that the center will be subject to IAEA safeguards. Burma is a party to the NPT; its Comprehensive Safeguards Agreement with the IAEA came into force in 1995. However, Burma has yet to rescind its Small Quantities Protocol, which provides for less intensive application of safeguards in countries that possess only small quantities of nuclear material, and has not signed or ratified an Additional Protocol with the IAEA.

Current U.S.-Russia Nonproliferation Programs

The United States continues to make great strides through its nonproliferation and threat reduction programs to reduce weapons of mass destruction (WMD), delivery systems and related materials, to enhance security of those which remain, to prevent proliferation of WMD expertise, materials and technologies, and to redirect former WMD personnel. Threat reduction programs were initiated in Russia following the collapse of the Soviet Union. In particular, the U.S. Departments of Energy, Defense, and State have implemented a broad range of nonproliferation and threat reduction efforts over the past decade to reduce the risk posed by unsecured chemical, biological, radiological, and nuclear (CBRN) expertise, materials, and technologies in Russia.

The Department of State focuses nonproliferation and threat reduction efforts in Russia on: 1) engagement and redirection of personnel with WMD and related expertise, including nuclear expertise; 2) export control and related border security (EXBS) assistance to improve control, detection, and interdiction capabilities related to transfers of WMD, conventional weapons, and related items; and 3) response to unanticipated nonproliferation opportunities and critical emergent needs through the Nonproliferation and Disarmament Fund (NDF).

The Department of Defense focuses threat reduction efforts in Russia on: 1) upgrades to security systems at Russian nuclear warhead storage sites, installation of an automated inventory management system for warheads slated for dismantlement, and transport of warheads for dismantlement or consolidated storage; 2) chemical weapons destruction; 3) dismantlement of intercontinental ballistic missiles, submarine launched ballistic missiles, and launchers; 4) security for dangerous pathogen collections; 5) engagement of former biological weapons

UNCLASSIFIED

UNCLASSIFIED

- 18 -

scientists and those with weapons-related expertise in mutually beneficial research; and, 6) elimination of WMD infrastructure.

The Department of Energy works with Russia on threat reduction efforts to: 1) enhance security of Russian fissile material and nuclear warhead sites not addressed by the U.S. Department of Defense; 2) enhance nuclear detection at major airports and border crossings; 3) shut down and monitor plutonium production reactors and ensure plutonium oxide from the reactors is not used in nuclear weapons; and, 4) facilitate the transition of scientists to commercial civilian projects.

On February 18, 1993, in one of our earliest and most significant nonproliferation cooperation programs, the United States and Russia signed the Agreement Concerning the Disposition of Highly Enriched Uranium Extracted from Nuclear Weapons ("the HEU Agreement"). Under this nonproliferation agreement, Russia committed to downblending 500 metric tons of HEU from dismantled Russian nuclear weapons, and converting it to LEU for use as power reactor fuel in the United States. The Department of Energy (DOE) and the Russian Federal Agency for Atomic Energy (Rosatom) have negotiated and implemented confidence-building transparency measures including the conduct of six Special Monitoring Visits (SMVs) per year at each of four Russian processing facilities to confirm that the nonproliferation objectives are met. Russia also has the right to conduct SMVs at seven facilities in the United States.

The purchase of the downblended HEU is implemented through a commercial contract between the United States Enrichment Corporation (USEC) and Technabsexport (Tenex). USEC purchases from Tenex the downblended HEU that is converted to LEU domestically in Russia. The LEU is then fabricated into fuel at U.S. fuel fabricators and used in U.S. commercial reactors. An estimated 322 metric tons of HEU has been downblended to date – enough material for nearly 12,880 nuclear weapons, based on the IAEA definition of a significant quantity of HEU.

The United States and Russia have also collaborated extensively in nuclear-related areas as allowed by law. At a February 2005 meeting in Bratislava, President Bush and President Putin committed to expanding and deepening cooperation on nuclear security, including a commitment to accelerate ongoing cooperation on security upgrades at Russian facilities with the goal of completing most of this work by the end of 2008. The United States and Russia also committed to enhance cooperation on emergency response capabilities to deal with

UNCLASSIFIED

UNCLASSIFIED

- 19 -

the consequences of a nuclear/radiological incident, including the development of additional technical methods to detect nuclear and radioactive materials that are, or may be, involved in the incident.

To date, the United States and Russia have secured hundreds of nuclear warheads at approximately 88 percent of the Russian warhead sites of concern, including all 39 Russian Navy nuclear sites and all 25 Strategic Rocket Forces sites. The United States and Russia have also completed security upgrades at 193 buildings containing hundreds of metric tons of weapons-usable nuclear material at 11 Russian Navy Fuel sites, 7 Rosatom weapons complex sites, 12 Rosatom civilian sites, and 6 non-Rosatom civilian sites. Work is underway at the balance of the warhead and material sites, most of which will be completed on an accelerated basis by the end of 2008.

In addition, since the inception of threat reduction assistance programs, the United States has employed tens of thousands of former weapons personnel in peaceful pursuits at over 200 institutes. Over 550,000 sq. ft. of floor space of Russia's nuclear weapons complex has been converted to civilian industry. Nuclear weapons assembly at the Avangard plant and at Zarechny have shut down, and only two facilities in Russia continue to assemble or disassemble nuclear warheads.

Through the Elimination of Weapons-Grade Plutonium Production program, the United States has been working with Russia to facilitate the shut down of Russia's last three plutonium-producing reactors, two at Seversk and one at Zheleznogorsk. The first of the Seversk reactors was shut down on April 20, 2008. These reactors will be replaced by new and refurbished fossil-fuel plants that will supply heat and electricity to those two cities. Following shutdown, these reactors will be monitored annually under the PPRA to ensure they remain inoperable until permanently dismantled. In cooperation with the United States, Russia is also permanently disposing of 34 metric tons of its surplus weapon-grade plutonium by irradiating it as mixed-oxide fuel in nuclear reactors.

Cooperation under the Second Line of Defense program began in 1998 to strengthen Russia's capability to detect and deter illicit trafficking in nuclear and other radioactive materials across international borders and through the maritime shipping system. Under this program the United States and Russia are jointly working to equip all of Russia's border crossings with radiation detection equipment, for a total of 350 sites, by the end of 2011. A total of 117 sites in Russia have been equipped at the time of this NPAS.

UNCLASSIFIED

UNCLASSIFIED

- 20 -

Current U.S.-Russia Civil Nuclear Cooperation

As previously noted, the 1993 HEU Agreement allows for the purchase of Russian LEU derived from downblended HEU for use in the United States. Under this nonproliferation agreement, 30 metric tons of HEU are converted and processed into about 875 metric tons of low enriched uranium (LEU) annually for use in U.S. commercial reactors. This quantity of LEU meets half of the annual fuel requirements for U.S. nuclear power plants.

To date, Russian imports of LEU into the U.S. market have been restricted to the downblended HEU received under the HEU Agreement. This was mandated by the 1992 Suspension Agreement, which balanced restrictions on Russian imports with a suspension of an antidumping investigation of Russian imports. At the time, both foreign-origin uranium directly imported into the United States and U.S.-origin uranium that had been enriched at an overseas facility and returned to the United States were viewed to be goods subject to such agreements. However, a recent U.S. court decision, which is subject to review by the U.S. Supreme Court, redefined enrichment as a "service" rather than a "good," which would remove enrichment from anti-dumping legislative controls. If not overturned, this court action could open the door for unlimited access of Russian enrichment services into the U.S. market.

In addition, an amendment to the Suspension Agreement was recently signed between the Department of Commerce and Rosatom, allowing for limited amounts of Russian commercial LEU to enter the United States based on a quota system.

Negotiation of the 123 Agreement has proceeded independently of the recent developments with respect to the U.S.-Russia HEU Agreement. The 123 Agreement, if signed and brought into force, is not expected to have any bearing on the continued implementation of the HEU Agreement through its conclusion in 2013. In particular, it is anticipated that any transfers of natural uranium from the United States to Russia in support of the HEU Agreement will continue to be handled as "distributions" by the Department of Energy pursuant to section 64 of the U.S. Atomic Energy Act of 1954, as amended, and therefore take place pursuant to the nonproliferation conditions and controls set forth in a U.S.-Russia exchange of diplomatic notes of March 24, 1999, constituting an agreement between the Government of the United States of America and the Government of the Russian Federation regarding assurances concerning the source material

UNCLASSIFIED

UNCLASSIFIED

- 21 -

transferred from the United States to the Russian Federation in implementation of the HEU Agreement, rather than pursuant to the 123 Agreement.

On a bilateral basis, the Department of Energy and Rosatom completed a joint workplan on December 15, 2006, to implement a non-binding initiative to coordinate and enhance global and bilateral nuclear energy cooperation. The areas of potential cooperation outlined in the bilateral action plan are: advanced reactors, exportable small and medium reactors, nuclear fuel cycle technologies, and nonproliferation. Activities for this action plan are underway and meetings have been conducted. In a multilateral setting for civil nuclear cooperation, Russia, along with the other advanced nuclear technology states of China, France, Japan, joined the U.S.-led Global Nuclear Energy Partnership (GNEP). Russia has signed the policy framework document known as the GNEP Statement of Principles and has participated in meetings concerning the development and the direction of the Partnership.

II. Scope of the Cooperation Contemplated in the Proposed Agreement

Article 2 of the proposed Agreement describes in general terms the kinds of cooperative activities envisaged. These include:

- Scientific research and development pertaining to the nuclear power sector.
- Scientific research and development in the field of controlled thermonuclear fusion.
- Radioactive waste handling, decommissioning of nuclear facilities, and environmental restoration.
- Nuclear and radiation safety.
- Nuclear industry and commerce.
- Shipments pursuant to the Agreement of moderator material, nuclear material, technology and equipment.
- Cooperation in issues of nonproliferation, IAEA safeguards, and environmental protection.

UNCLASSIFIED

UNCLASSIFIED

- 22 -

Article 3.4 provides that the cooperation envisaged by the proposed Agreement as cooperation between the U.S. Government and the Government of the Russian Federation may also be carried out between their respective authorized persons.

Article 7.4 provides that nuclear material, moderator material, equipment, or components transferred from the territory of one Party to the territory of the other Party, either directly or through a third country, shall be regarded as having been transferred pursuant to the Agreement only upon confirmation by the recipient Party that such items will be subject to the Agreement.

Sensitive nuclear facilities, sensitive nuclear technology, and major critical components may be transferred under the Agreement if provided for by an amendment to the Agreement to permit such transfers (Article 7.2).

The Agreement does not permit transfers under it of Restricted Data or the Russian equivalent of Restricted Data, nor does it permit transfers of Russian State Secret Information (Article 6.2 and 6.3).

The proposed Agreement will have a term of 30 years from the date of its entry into force, and may be terminated by either Party on one year's written notice to the other Party (Article 20.1). In the event of suspension, termination, or expiration of the Agreement, key nonproliferation conditions and controls provided for in the Agreement will continue in effect as long as nuclear items subject to the Agreement remain in the territory of either Party or under the jurisdiction or control of either Party anywhere unless the Parties agree otherwise, or unless such items are no longer usable for any nuclear activity relevant from the point of view of international safeguards or have become practicably irrecoverable (Article 20.2).

III. Substantive Conditions

The proposed Agreement meets the applicable requirements of the Atomic Energy Act and the NNPA.

Section 123 a. of the Act sets forth nine specific requirements that must be met in agreements for cooperation. Sections 402 and 407 of the NNPA set forth supplementary requirements. The provisions contained in the proposed Agreement satisfy these legal requirements as follows:

(1) Application of Safeguards: Under section 123 a.(1), the Government of the Russian Federation (GOR) must guaranty "that safeguards . . . will be

UNCLASSIFIED

UNCLASSIFIED

- 23 -

maintained with respect to all nuclear materials and equipment transferred pursuant [to the Agreement] and with respect to all nuclear material used in or produced through the use of such [transferred] nuclear materials and equipment, so long as the material or equipment remains under the jurisdiction or control of [the GOR], irrespective of the duration of the other provisions of the agreement or whether the agreement is terminated or suspended for any reason.”

This requirement is satisfied by Articles 13 and 20 of the proposed Agreement. Article 13(2) stipulates that nuclear material transferred to the Russian Federation pursuant to this Agreement and any other nuclear material used in or produced through the use of nuclear material, moderator material, equipment, or components transferred shall be subject, to the extent applicable, to the Agreement between the Russian Federation and the IAEA for the Application of Safeguards in the Russian Federation of February 21, 1985, and an Additional Protocol that entered into force October 16, 2007. Article 13(4) provides for “back-up” safeguards in the event the IAEA safeguards agreement with the GOR is not being implemented. Article 13 is one of the articles that, pursuant to Article 20, continues in effect so long as any nuclear material, moderator material, equipment, or component subject thereto remains in the territory of the United States of America or the Russian Federation or under the jurisdiction or control of either Party to the Agreement anywhere, unless that item is no longer usable for any nuclear activity relevant from the point of view of international safeguards or has become practically irrecoverable, or unless otherwise agreed by the Parties.

(2) Full-Scope Safeguards: The requirement for full-scope safeguards as a condition of cooperation mandated by section 123 a.(2) of the Act is not applicable because the Russian Federation is a nuclear weapon state party to the Treaty on the Non-Proliferation of Nuclear Weapons, done at London, Washington, and Moscow, July 1, 1968.

(3) Peaceful Use: The requirement of section 123 a.(3) of the Act for a guaranty against explosive or military uses of nuclear materials and equipment transferred and special nuclear material produced through the use of such items is met by Article 12 of the proposed Agreement. Moreover, Article 7(2) of the proposed Agreement provides that sensitive nuclear technology may be transferred under the Agreement if provided for by an amendment to the Agreement. Therefore, it is not necessary at this time to include a peaceful uses guaranty with respect to sensitive nuclear technology transferred under the Agreement or special nuclear materials (referred to in the proposed Agreement as “special fissionable

UNCLASSIFIED

UNCLASSIFIED

- 24 -

materials”) produced through the use of sensitive nuclear technology transferred, as would otherwise be required by section 123 a.(3) of the Act.

(4) Right of Return: The requirement in section 123 a.(4) of the Act that the United States has a right to the return of any nuclear material and equipment transferred pursuant to an agreement for cooperation and any special nuclear material produced through the use of such transferred items in the event of a nuclear detonation by a non-nuclear weapon state cooperating party is inapplicable because the Russian Federation is a nuclear weapon state party to the NPT.

(5) Retransfer Consent: The requirement of section 123 a.(5) of the Act for a guaranty that any material and equipment transferred pursuant to an agreement for cooperation and any special nuclear material produced through the use of such items will not be transferred to unauthorized persons or beyond the jurisdiction or control of the Russian Federation without U.S. consent is met by Article 8(2). A retransfer consent right over Restricted Data (RD) is not provided because RD transfers by the United States of America are prohibited under Article 6(2) of the Agreement.

(6) Physical Security: The requirement of section 123 a.(6) of the Act for a guaranty that adequate physical security will be maintained with respect to any nuclear material transferred pursuant to an agreement of cooperation and any special nuclear material used in or produced through the use of nuclear material or equipment transferred is met by Article 11 of the proposed Agreement.

(7) Enrichment/Reprocessing/Alteration Consent Right: The requirement of section 123 a.(7) of the Act for a guaranty that “no material transferred pursuant to the agreement for cooperation and no material used in or produced through the use of any material, production facility, or utilization facility transferred pursuant to the agreement will be reprocessed, enriched, or (in the case of plutonium, uranium 233, or uranium enriched to greater than twenty percent in the isotope 235, or other nuclear materials which have been irradiated) otherwise altered in form or content without the prior approval of the United States,” is met by Article 9 of the proposed Agreement. That Article provides that nuclear material transferred pursuant to the Agreement, and nuclear material used in or produced through the use of nuclear material, moderator material, or equipment transferred, may be altered in form or content only if the Parties agree, and further sets forth the Parties’ agreement that conversion, enrichment to less than 20 percent in the isotope uranium-235, fabrication of low enriched uranium fuel, irradiation or further irradiation, post-irradiation examination, and blending or downblending of

UNCLASSIFIED

- 25 -

uranium to produce low enriched uranium, are permissible alterations in form or content for purposes of the Agreement.

Article 9 prohibits reprocessing and enrichment of nuclear material transferred pursuant to the proposed Agreement, or nuclear material used in or produced through the use of nuclear material, moderator material, or equipment transferred, without prior U.S. consent, by prohibiting *all* alterations in form or content of such nuclear material rather than specifically naming reprocessing and enrichment. Section 123 a.(7) of the Act refers to reprocessing, enriching, or "otherwise" altering in form or content, thereby indicating that reprocessing and enrichment are alterations in form or content. As noted above, Article 9 goes on to provide U.S. consent for certain types of alteration in form or content, including enrichment to less than 20 percent, but does not include reprocessing in the list of activities for which U.S. consent is given.

Article 9 also satisfies section 402(a) of the NNPA, which states that, except as specifically provided in any agreement for cooperation, no source or special nuclear material exported from the United States after the date of the NNPA may be enriched after export without the prior approval of the United States for such enrichment.

(8) Storage Consent Right: The requirement of section 123 a.(8) of the Act for a guaranty of a right of prior U.S. approval over facilities for the storage of specified nuclear materials is met by Article 8(1).

(9) Sensitive Nuclear Technology: The requirement of section 123 a.(9) of the Act pertains to situations that may result when sensitive nuclear technology is transferred pursuant to a section 123 agreement for cooperation. Article 7(2) of the Agreement provides that sensitive nuclear technology, sensitive nuclear facilities, and major critical components may be transferred under the Agreement if provided for by an amendment to the Agreement. Accordingly, the requirement in section 123 a.(9) is not relevant to the proposed Agreement, and the requirement in section 402(b) of the NNPA precluding the transfer of major critical components of facilities for uranium enrichment, nuclear fuel reprocessing, or heavy water production unless an agreement for cooperation "specifically designates such components as items to be exported pursuant to [such] agreement" is also satisfied.

Environmental: Article 17 of the proposed Agreement requires the Parties to consult, with regard to activities under the Agreement, to identify the world-wide

- 26 -

environmental implications arising from such activities and to cooperate in protecting the international environment from radioactive, chemical, or thermal contamination arising from peaceful nuclear activities under the Agreement, thereby satisfying the requirements of section 407 of the NNPA.

The proposed agreement thus satisfies all the substantive requirements specified for agreements for cooperation by the Act and the NNPA.

IV. Conclusion

Entry-into-force of the proposed U.S.-Russia Agreement will put in place a framework for mutually beneficial civil nuclear cooperation between the two countries and provide a foundation for continued collaboration on nuclear non-proliferation goals.

On the basis of the analysis in this NPAS and all pertinent information of which it is aware, the Department of State has arrived at the following assessment, conclusions, views, and recommendations:

1. The safeguards and other control mechanisms and the peaceful use assurances in the proposed Agreement are adequate to ensure that any assistance furnished thereunder will not be used to further any military or nuclear explosive purpose.
2. The Agreement meets all the legal requirements of the Act and the NNPA.
3. Execution of the proposed Agreement would be compatible with the non-proliferation program, policy, and objectives of the United States.
4. Therefore, it is recommended that the President approve and authorize the execution of the proposed Agreement; and that the President determine that the performance of the proposed Agreement will promote, and will not constitute an unreasonable risk to, the common defense and security.
